III. Pipeline

The problem and the shape of the solution — We turn dense Romanian legal PDFs into plain-language versions and prove the change with objective numbers, using an agentic pipeline: two AI agents for the language work, deterministic code for anything that must be reliable.

Ingest — Read legal documents from a folder and extract their text so the rest of the pipeline has clean input.

Input is PDFs, the real-world format legal texts arrive in.

Each document flows through the same steps independently.

Simplify (Agent 1) — An AI agent rewrites the text into plain Romanian, guided by an external rules file rather than hard-coded instructions.

The rules come from established plain-language principles, adapted to Romanian.

Keeping them in an editable file means the policy can change without changing the code.

Measure (deterministic) — We score readability on the original and the simplified text and compare, so improvement is evidence-based, not a matter of opinion.

Indices are grounded in published NLP research on Romanian textual complexity.

This is code, not an agent, because measurement must be repeatable and trustworthy.

Summarize and package (Agent 2 + deterministic) — A second agent extracts the key points; code assembles a final PDF with the summary, the score comparison, and the plain version.

Agents generate content; code handles rendering — each does what it's reliably good at.

The output carries a disclaimer, because simplification can shift legal meaning.

The takeaway lesson — The pipeline's design principle is knowing where to trust AI judgment and where to demand deterministic guarantees, plus building for honesty (documented approximations) and verification (test offline, then debug the real run).

IV. Evaluation

6 sources-Jul 2, 2026

These legislative documents outline a series of regulatory updates and administrative mandates in Romania, covering public safety, financial oversight, and social welfare. Key provisions include stricter national defense protocols, such as a new voluntary military training program and mandatory reporting for reservists, alongside reforms to judicial and specialized pensions. The sources also detail enhanced infrastructure investments, including road connectivity projects and the modernization of medical programs, while establishing new digital registries for land management and local police surveillance. Furthermore, the texts provide for expanded social support, offering transportation subsidies for students, indemnities for youth leaving protective care, and emergency humanitarian aid for regions affected by extreme weather. Educational and cultural initiatives are also formalized, such as the "One Book for Everyone" program and the designation of national commemorative days.

What are the new benefits for students and young adults?

How is the retirement system changing for Romanian legal professionals?

Explain the new military service and national defense obligations.

Compare the indices in the tables for all the documents. What conclusions can be drawn based on that? Is there a particular trend or are the results not representative?

Based on a comparison of the readability indices (ReaderBench lexical indices) across the six provided documents, several trends and conclusions regarding the automated simplification process can be identified. These tables compare the Original legal text with a Simplified version intended for easier reading.

Consistent Trends Across Documents

- **Reduced Lexical Diversity (Entropy):** In 100% of the documents, the entropy of words decreased in the simplified version. This indicates that the simplified texts consistently use a less diverse and more repetitive vocabulary to enhance clarity.
- **Lower Sentence Density:** In five out of six documents, the number of unique content words per sentence decreased. This suggests that the simplified versions generally present fewer complex concepts per sentence compared to the original legislative text.
- **Increased Morphological Complexity (Flexion):** Interestingly, the average word-lemma distance (an indicator of grammatical flexion) increased in five out of six cases. This suggests that while the sentences are shorter, the specific forms of the words used may technically be more complex in their inflected states.

General Trends in Readability

- **Sentence Length:** Most documents (5 out of 6) showed a significant reduction in average sentence length. For example, in Official Gazette No. 282, the average sentence length dropped by 14.559 words.
- **Word Length:** The results for average word length were mixed; in half the cases, words became slightly longer (more complex), while in the other

- Official Gazette No. 10 (Source 2): This document is the primary outlier. Unlike the others, its "simplified" version actually resulted in longer sentences (+9,466 words) and a higher number of unique content words per sentence (+3,557). According to the ReaderBench evaluation in that specific table, these changes made the text more complex rather than simpler in those categories.
- Official Gazette No. 151 (Source 4): This is the only document where every single index improved toward simplicity, including a decrease in word-lemma distance (-0.205), making it the most consistently "simplified" document in the set.

Conclusions on Representativeness

The results are largely representative of a trend toward structural simplification (shorter sentences) and lexical narrowing (lower entropy). However, the data also shows that the automated process is not uniform. The fact that word-lemma distance often increases suggests that "simplification" focuses more on syntax and vocabulary variety than on the grammatical simplicity of individual words.

The presence of a significant outlier in Official Gazette No. 10 indicates that the automation may occasionally produce a text that is structurally more dense than the original, even while reducing overall lexical diversity. Therefore, while a general trend toward simplification is evident, the results for individual documents can vary significantly depending on the original text's structure.

Why was Official Gazette No. 10 a trend outlier?

Tell me more about the entropy results across documents.

How did word-lemma distance change in the latest documents?

Rank the 6 documents based on the original complexity (as shown by the indices) from most to least complex.

Based on the indices provided in the sources, the six documents can be ranked from most complex to least complex based on their original legal text. Complexity is primarily determined by longer average sentence lengths, higher lexical diversity (entropy), and a higher density of unique content words per sentence.

Ranking of Documents (Most to Least Complex)

1. Official Gazette No. 282 (Source 6): This is the most complex document. It has the longest average sentence length (34,595 words) and the highest number of unique content words per sentence (16,541). It also features the highest "word-lemma distance" (1.343), indicating significant grammatical flexion.
2. Official Gazette No. 151 (Source 4): This document ranks second, closely following No. 282. It possesses the highest lexical diversity (entropy) of all six documents at 9.011 and has a high average sentence length of 32,939 words.
3. Official Gazette No. 207 (Source 5): This document is highly complex due to its high entropy (8.982) and a dense structure, with 14,654 unique content words per sentence and an average sentence length of nearly 30 words.
4. Official Gazette No. 1204 (Source 1): While this document has a relatively high average sentence length (30,922 words), its lexical diversity (entropy) is the lowest in the set at 8.353, making its vocabulary slightly more predictable and therefore less complex than the top three.
5. Official Gazette No. 27 (Source 3): This document is significantly less complex than the previous four. Its average sentence length drops to 24,629

words, and it has a lower entropy of 8.494.

What causes the high word-lemma distance in Document 282?

Why did simplification make Document 10 more structurally complex?

How did Document 151 achieve simplicity across all its indices?

now rank the documents based on the simplified complexity, again from most to least. Is the order the same as for the original ranking?

Based on the indices for the simplified versions of the documents, the ranking of complexity changes significantly. The order is determined primarily by the simplified average sentence length and the density of unique content words per sentence.

Ranking of Simplified Documents (Most to Least Complex)

1. Official Gazette No. 151 (Source 4): This is the most complex simplified document. While its lexical diversity (entropy) dropped significantly, it still maintains the longest average sentence length by a wide margin (32.118 words).
2. Official Gazette No. 10 (Source 2): This document is the second most complex. Notably, its "simplified" version actually increased in structural complexity compared to the original, resulting in an average sentence length of 27.574 words and the highest density of unique content words (13.011) in this group.
3. Official Gazette No. 207 (Source 5): This ranks third with a moderate simplified sentence length of 24.04 words and a low entropy of 6.997.
4. Official Gazette No. 1204 (Source 1): This document follows closely with an average sentence length of 23.679 words and a slightly higher word density (12.75) than No. 207.
5. Official Gazette No. 27 (Source 3): This is one of the simpler documents, with average sentences reduced to 20.521 words and the lowest density of unique content words per sentence (10.767).
6. Official Gazette No. 282 (Source 6): This is the least complex simplified document structurally. It achieved the most dramatic reduction in sentence length, ending with an average of just 20.036 words per sentence.

Comparison: Is the order the same?

No, the order is not the same. In fact, the ranking has shifted dramatically for the documents at the extreme ends of the scale:

- The "Flips": Official Gazette No. 282, which was the most complex in its original form, is now the least complex after simplification. Conversely, Official Gazette No. 10, which was the least complex originally, is now the second most complex because the simplification process actually increased its sentence length and word density.
- Consistency: Only Official Gazette No. 151 remained near the top of the complexity list in both versions, as its simplified sentences remained relatively long despite other improvements.
- The Middle Ground: Documents like No. 1204 and No. 207 remained in the middle of the rankings, showing that their relative complexity stayed fairly stable during the simplification process.

2. Human evaluation

- 5 participants (higher education, different profiles, ages 26–59, Romanian as native language) asked to read both the original document and simplified version

- Result: The questions in the simplified form received slightly more favorable scores compared to the original document test group => easier to understand

V. Areas of improvement and future outlook

Scope

- Increase nr. of documents to be simplified
- Larger size and more diverse sample in terms of education and regions necessary
- more in-depth questionnaire -> ask targeted questions about the content of the documents to determine level of understanding

Pipeline

- Potentially use more complex framework of ReaderBench incorporating Latent Semantic Analysis (LSA) and Latent Dirichlet Allocation (LDA)
- Use open-source, locally run alternatives
- Currently not possible to ask questions about the file / elaborate -> incorporation of a dedicated chatbot?
